# ECHO-AWARE signal processing for audio scene analysis

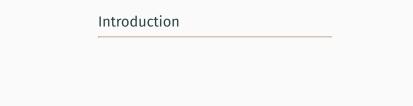

Diego DI CARLO

November 20, 2020

suprevisors: Antione DELEFORGE, Nancy BERTIN

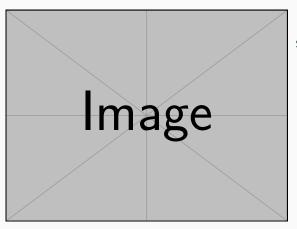

collaborators: Clément ELVIRA, Robin SCHEIBLER, Ivan DOKMANIĆ, Sharon GANNOT, Pini A

INRIA IRISA

# Scenario

#### Meeting - 2020 edition

#### Sound

- produced by
- recorded by microphones
- corrupted by noise
- propagates in the room
  - $\hookrightarrow$  reverberation

Attention: artificial sound vs (natural) microphone recordings

# Echo-aware signal processing for audio scene analysis

#### Semantic information

about source nature and semantic content

# **Spatial** information

about source position and room geometry

Temporal information

about events activity

#### Audio Scene Analysis

Extraction and organization of all the information in the sound

 $\rightarrow$ 

 $\rightarrow$ 

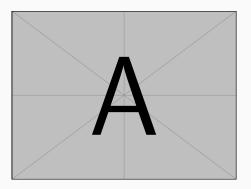

Animals do it, Humans do it. Can computer and robots do it?

# Echo-aware signal processing for audio scene analysis

#### Signal Processing

Mathematical models, frameworks and tools to tackle and solve such problems

#### Some problems

- Speaker Verification
- Sound Source Separation
- Speech Enhancement
- Automatic Speech Recognition
- Sound Source Localization
- Room Geometry Estimation
- Voice Activity Detection
- Diarization
- RT<sub>60</sub> estimation
- Wall Absorption Estimation
- · and many many other

What?

Who?

vviiat:

 $\begin{array}{l} \textbf{Everything is connected} \\ \textbf{HOW} \rightarrow \textbf{WHERE} \rightarrow \textbf{WHEN} \rightarrow \textbf{WHAT} \end{array}$ 

# Echo-aware signal processing for audio scene analysis

#### **Acoustic Echoes**

- Sound reflection standing out for time and strength w.r.t. to the total reverberation
- · repetition of the source sound
- but later
- · both outdoor and indoor

#### Echo-aware processing

# Free-field processing

- (only direct path)

  ✓ "simple" processing
  - ✓ "short" processing
  - X Reflection are interferences
  - Neglect most of the sound energy
  - ✗ incoherence ⇒ distortion

# Echo processing

(only specular reflection)

- · short processing
- · simple processing
- reflection are integrated, late reverberation can considered
- reflection are difficult to estimate
- reflection need to be correctly estimated

# Reverberant processing (entire sound field)

- difficult processing
- · long precessing
- Reflection perfectly integrated

# Thesis goal and contribution

Audio Scene Analysis	Signal Processing	Acoustic Echoes
<b>↓</b>	<b>\</b>	$\downarrow$
context and problems	models and frameworks	better processing

#### Thesis objective

- 1. provide new methodologies and data to process and estimate acoustic echoes
- Turning echoes into friends [?] extend previous classical methods for audio scene analysis

#### contribution Estimation

- · Knowledge-based echo estimation, aka Blaster
- · Learning-based echo estimation, aka Lantern

#### Application

- Echo-aware Source Separation, aka Separake
- Echo-aware Source Localization, aka Mirage
- · Echo-aware Speech Enhancement
- · Echo-aware Room Geometry Estimation

5

From Physics to Digital Signal Processing Introduction Blaster Echo-aware signal Lantern processing Interim conclusion (2/4)for audio scene analysis introduction mirage Interim conclusion (3/4) Echo-aware Dataset Dataset for Echo-aware processing

Introduction Motivation Outline

# Modeling

#### **Echoes and Room Acoustics**

#### Sound propagates and interacts with space

- it travels with a certain speed and it is attenuated;
- · it is absorbed and reflected by surfaces;
- · and it is scattered, diffracted, etc.

This is describe by the so called RIRs

# Elements of reverberation [?, ?, ?, ?]

- · Direct path
- Early Echoes
- · Reverberation tails

#### Early Echoes

# Echoes and Room Impulse Response

#### RIRs can be modeled with the Image Methods

- · specular reflection only
- · "playing billiard in a concert hall"
- for shoebox room it is is the solution for physics
- $\cdot$  in frequency domain it writes as

#### RIRs accounts for

the geometry of the room

- · Room shape and size
- · Mic and Source position
- · presence of objects

the acoustic properties of the audio scene

- · surface materials
- objects materials

#### examples

# Echoes in (Digital) Signal Processing

#### Room Impulse Response

$$\tilde{x}_i = (\tilde{h}_i * \tilde{s})(t) \longrightarrow \tilde{X}_i(f) = \tilde{H}_{ij}(f)\tilde{S}(f)$$

the linear filtering effect due to the propagation of sound from a source to a microphone in a indoor space

#### Observation

Our vision is limited both in time (finite and discrete) and in frequency (finite and discrete)

$$x_i[n] = \dots (1)$$

#### Signal model in the frequency domain

$$x_i = (h_i * s)(t) \ \longrightarrow \ X(f) = H_i(f)S(f)$$

#### **Approximations**

- Narrowband Approximation
- · DTFT echo model in the DFT

8

#### Interim Conclusion I

#### **Approximations**

- Echoes are well described by specular reflection
- · Echoes are off-grid by nature
- · Sampling and quantization make them hard
- Processing in the discrete frequency domain, but with continuous time echo model

# Acoustic Echo Estimation

#### Acoustic Echo Retrieval

Given the echo model

$$H_{ij}(f) = \sum_{r=0}^R \alpha e^{2\pi},$$

#### The acoustic echoes retrieval (AER) problem

Estimating early (strong) acoustic reflections:

- their time of arrivals  $\rightarrow$  TOAs Estimation
- their amplitude  $\hookrightarrow$  closed-from knowing  $\tau$  [?]

Note that an order of r

# Taxonomy of Acoustic Echo Estimation

#### based on the emitted signal knowledge:

#### Active approaches

- · Signal is emitted and known
- Intrusive
- · Single channel
- Methods: Least-Square estimation, Inverse Filtering (Equalization)
- Application: measurements, calibration, sonars, slam

#### Passive approaches

- · Emitted signal is not known
- · Not intrusive (for passive listening)
- Multichannel
- Application: Robot hearing (Table Top Scenario), Pre-processing step

# Taxonomy of Acoustic Echo Estimation

#### based on the estimated filter:

#### RIR-based approaches

- RIRs are first estimated as SIMO BCE problem
- Echoes extracted from first part of the RIRs with peak picking and disambiguation

#### Pros

- SIMO BCE is well studied (elegant framework)

#### Cons

- · Full RIR
- dependent of manually tuned peak picking
- Pathological issue (sampling and body-guard
- Complexity
- · Non-negativity and sparsity not true

#### RIRs-agnostic approaches

1. Estimation directly in the echoes parameters space  $\{\tau,\alpha\}$  and direction of arrivals can be used instead

#### Performed with

- Cross-correlation on-grid, eg. EM, Acoustic Cameras
- Cross-relation with super-resolution off-grid, [?, ?]

#### Pro

- No need for full RIRs
- · Sub-sampling accuracy
- · Low complexity
- Sparsity and Non-negativity are respected

#### Cons

Exploratory

#### AER as discrete SIMO BCE

### Key ingredient – Cross relation identity

$$x_i = h_i * s$$
 
$$h_2 * x_1 = h_2 * h_1 * s = h_1 * h_2 * s = h_1 * x_2$$

#### Ideas

- 1. Sampled version of  $x_1, x_2$  are available  $(\mathbf{x}_1, \mathbf{x}_2)$
- 2. Assume echoes belong to multiples of the sampling frequency
- 3. Identify echoes ightarrow find sparse vectors  $\mathbf{h}_1,\mathbf{h}_2$
- 4. Lasso-like problem

$$\widehat{\mathbf{h}}_1, \widehat{\mathbf{h}}_2 \in \mathop{\arg\min}_{\mathbf{h}_1, \mathbf{h}_2 \in \mathbf{R}^n} \|\mathbf{x}_1 * \mathbf{h}_2 - \mathbf{x}_2 * \mathbf{h}_1\|_2^2 + \lambda \mathrm{Reg}(\mathbf{h}_1, \mathbf{h}_2)$$
 
$$\mathrm{Reg}(\mathbf{h}_1, \mathbf{h}_2) \longrightarrow \mathrm{sparse \ promoting \ regularizer}$$

5. Pick picking

13

# Limitations / bottleneck

#### Limitations

- · Echoes are not necessarily "on grid"
- · Body guard effect [?]
  - $\rightarrow$  low recall  $\Rightarrow$  low accuracy
  - $\longrightarrow$  slow convergence

→ Increase Precision

#### Computational bottleneck

- · Bigger vectors and matrices
  - → memory usage
- Computational complexity: at best  $\mathcal{O}(F_s^2)$  per iteration
- $\cdot$  the higher the sampling frequency, the more ill-conditioned
  - → slow convergence

# Blaster- Off-grid BCE

Observation 1: the cross relation remains true in the frequency domain

$$\mathcal{F} x_1 \cdot \mathcal{F} h_2({}^n \! / \! F_s) = \mathcal{F} x_2 \cdot \mathcal{F} h_1({}^n \! / \! F_s) \qquad n = 0 \dots N-1$$

Observation 2:  $\mathcal{F}\delta_{\text{echo}}$  is known in closed-form

Observation 3:  $\mathcal{F}x_i$  can be (well) approximated by DFT

$$\mathbf{X}_i = \mathsf{DFT}(\mathbf{x}_i) \simeq \mathcal{F}\mathbf{x}_i(nF_s) \qquad n = 0 \dots N-1$$

Idea: Recover echoes by matching a finite number of frequencies

$$\underset{h_1,h_2 \in \underset{\text{Space}}{\text{measure}}}{\arg\min} \ \tfrac{1}{2} \|\mathbf{X}_1 \cdot \mathcal{F} h_2(f) - \mathbf{X}_2 \cdot \mathcal{F} h_1(f)\|_2^2 + \lambda \|h_1 + h_2\|_{\text{TV}} \quad \text{s.t. } \begin{cases} h_1(\{0\}) = 1 \\ h_l \geq 0 \end{cases}$$

Instance of a BLasso problem [?] (Sliding Frank-Wolfe algorithm)

no Toeplitz matrix

Solutions is anchor prevents a train of Dirac trivial solution

# **Blaster-** Experiments

#### Experiments

- simulation data with ISM with Pyroomacoustics
- · 1 source, 2 microphones, random room geometry
- · Full RIRs
- · 2 sources: broadband and speech
- · 2 datasets: different SNR, different RT60

#### Methods

- BSN: Blind Sparse and Nonnegative SIMO BCE [?]
- IL1C: Iteratively-weighted  $\ell_1$  Constraint SIME BCE  $\cite{ME}$
- · Blaster: Proposed off-grid approach

#### Metrics

- RMSE
- Precision

# Blaster- Results

#### Lantern-data-driven AER

Observation 1: Mapping from observation to echo is extremely difficult Later echoes are not considered, may help

Observation 2: We have acoustic simulators
Acoustic simulators based on ISM
source position, room ← reverberation elements ←
annotation for free

Observation 3: (Deep) Learning-based methods successful for localization Echoes are strongly related to the source position

#### Idea: Use Deep Learning for AER

- Extend previous work on source localization for Echo Estimation
- Estimate the first echo TOA
  - $\hookrightarrow$  simple case, but with important application in SSL

#### Lantern- Data & Models

#### Data

- · train:
  - → artificially generated RIR
  - $\hookrightarrow$  white noise + noise
- · test:
  - → artificially generated RIR

#### Architecture

- · models: MLP, CNN
- · loss: Multi-class regression problem
  - $\hookrightarrow \mathsf{RMSF}$
  - Gaussian regression + uncertainty
  - $\hookrightarrow$  Student Regression + uncertainty

# Lantern- Experiments & Resuls

#### Experiments

- 1. MLP
- 2. CNN
- 3. CNN + Noise
- 4. CNN + Gaussian
- 5. CNN + Student

# Results

- 1. MLP
- 2. CNN
- 3. CNN + Noise
- 4. CNN + Gaussian
- 5. CNN + Student

# Interim conclusion (2/4)

#### on Acoustic Echo Retrieval:

- Most of the literature is on Passive and RIR-based, with on-grid approaches
- On-grid approaches suffers by the off-grid nature of the echoes (complexity, sampling)

#### on Blaster:

- ✓ off-grid parameter-free which exploit dirac closed-form model (non negativity and sparsity)
- ✓ smaller RMSE due to super-resolution, better for small # of echoes
- x source dependent and on number of echoes
- × validate only on synthetic data
- → Multichannel and RTF-based extention

#### on Lantern:

- ✓ promising results for first echo estimation
- ✓ direct application for table top application
- **X** difficult extention
- x need for real data validation

# Echo-aware Application

# Audio signal processing and sound propagation

#### Sound propagation is [?]

$$\begin{split} x_i(t) &= (h*s)(t) \\ h(t) &= h^d(t) + h^e(t) + h^r(t) \\ H(f) &= \sum_{r=0}^R \alpha_i^{(r)}(f) \mathrm{e}^{-\mathrm{i} 2\pi \tau_i^{(r)} f_k} \end{split}$$

· completely ignored

$$\hookrightarrow h(t) = 1$$

· assumed direct path (anechoic case)

$$\hookrightarrow h(t) = h^d(t) + \varepsilon(t)$$

• fully modeled (reverberant case)

$$\hookrightarrow h(t) = h^d(t) + h^e(t) + h^l(t) + \varepsilon(t)$$

• early echoes (multipath case)

$$\hookrightarrow h(t) = h^d(t) + h^e(t) + \varepsilon(t)$$

## $\Leftarrow \textit{strong early reflection and strong reverberation level}$

- · detrimentally affect typical Audio Scene Analysis algorithm
- · undesired interfering source
- undesired position of the true sources (TDOA disambiguation)

# Echo-aware Application

#### What: echoes as sound repetition

- Sound Source Separation
- Speech Enhancement
   → Dereverberation, Denoising, Room Equalization
- · Speaker Verification

#### Where: echoes as new sound direction

- · Sound Source Localization
- · Microphone Calibration
- · Room Geometry Reconstruction

#### How: echoes as element of sound propagation

- Blind Acoustic Channel Estimation as initialization for other methods
- · Acoustic Measurements

# Echo-aware Application

#### What: echoes as sound repetition

- Sound Source Separation

#### How: echoes as element of sound propagation

- Blind Acoustic Channel Estimation as initialization for other methods
- · Acoustic Measurements

# Mirage- Sound Source Locatization with Echoes

#### The Picnic Scenario:

- Microphone close to a surface (table-top scenario)
- · Clear definition of the echo
- · One source

#### Mirage Array

How to access the image microphone

Each pair is augmented with echoes

# Mirage- Sound Source Locatization with Echoes

#### 1D SSL

- Estimate the TDOA between two microphones signals with GCC
- · Map the TDOA to angles knowing the array geometry

#### 2D SSL

- For each pair:
- Compute a global angular spectrum by "fusing" together the estimation of each pairs

#### Baseline:

GCC-PHAT on true microphones

#### Proposed Approach:

Using DNN-based TDOA estimation problem: real value not estimation

# Mirage-Results

#### Interim conclusion (3/4)

#### Echo-aware Audio Scene Analysis

- ✓ vast gamma of problems

  → not limited to audio (e.g., seismology, medical imaging, astrophysics, etc.)
- ✓ between anechoic and reverberant propagation
- ✓ physical-interpretation (with virtual microphones)
- performance depending on the quality of the echo-estimation still very challenging task
- X ....

#### Mirage & echo-aware SSL

✓ impossible 2D localization with only 2 microphones

#### Separake & echo-aware SSS

· nice

Echo-aware Dataset

#### Echo-aware Datasets

#### Data in audio signal processing

- 1. are necessary for validating (and learning) models
- collecting real data is a not always possible annotation and recording require expertise, equipment and time
- dataset of real data cannot be easily shared they do not generalize to different use-cases and scenarios (array, recording scenario)
- simulated data are used instead: quantity, versatility, annotation easiness and "quality"

#### Echo-aware Data in audio signal processing

For  ${\sf SE}\,:$  strong echoes, but not annotated

[?, ?, ?]

For RooGE: good geo. annotation, but no variety of acoustic scenarios

[?, ?, ?]

## dEchorate realization

#### **Echo Annotation**

- 1. RIR estimation with ESS [?]
- 2. IPS with beacon
- GUI for echo annotation Skyline, Matched Filter, Assisted Peak Picking
- 4. Refined position with Least Square optimization
- 5. iterate including ceiling (perfectly flat)

## dEchorate realization

TABLES RESULTS HERE

#### Speech Enhancement

Improve the quality of a target sound source with respect:

- interferences, i.e. form other sources → sound source separation
- background noise → denoising
- reverberation → dereverberation, room equalization

#### Spatial filtering via Beamformers

- · Is a speech enhancement techniques for multichannel
- · vs. Wiener Filtering, the target is distortionless
- · in anechoic case, it correspond to delay-and-sum beamformer
- · physical interpretation with steering vector based on DOA
- both in time and frequency domain

#### Speech Enhancement

improve the quality of a target sound source with respect:

- interferences, i.e. form other sources → sound source separation
- background noise → denoising
- reverberation → dereverberation, room equalization

#### Spatial filtering via Beamformers

- · Is a speech enhancement techniques for multichannel
- · vs. Wiener Filtering, the target is distortionless
- · in anechoic case, it correspond to delay-and-sum beamformer
- · physical interpretation with steering vector based on DOA
- both in time and frequency domain

Beamforming: Delay and Sum

$$\mathbf{y}[l,k] = \mathbf{W}^{\mathsf{H}}\mathbf{x}[l,k]$$

STFT Signal Model

$$\mathbf{x}[l,k] = \mathbf{H}[k]\mathbf{s}[l,k] + \mathbf{n}[l,k]$$

Beamforming: Filter and Sum

$$\mathbf{y}[l,k] = \mathbf{W}^{\mathsf{H}}\mathbf{x}[l,k]$$

Beamforming in the STFT domain: apply filter and sum independently at each frequency bin

# The PSD of various components asd

#### Different Criteria and Solution
